## Specialists in Rapid-Response Reconditioning

Thames-based A&G Price Ltd has added a new service to its extensive engineering capabilities — cost-effective, on-site maintenance of industrial plant.

A familiarity with heavy mining, locomotive, and industrial equipment stretching back almost 140 years — often as the original manufacture — enables A&G Price to repair and recondition hydro turbines, roller mill housings, heavy presses, rock crushers, complete gearboxes and other demanding machinery, economically and effectively. Often A&G Price will work with the client to incorporate design enhancements and material modifications as part of the refurbishment process.

Given the long lead times on the purchase of new heavy steel forgings and other replacement capital plant, the repair of legacy plant to 'as new' condition can prove a cost-effective solution, reducing down-time and significantly extending the productive life of essential machinery.

Responding to emergency breakdowns, scheduled factory shutdowns or routine maintenance requirements, A&G Price's

engineering team is committed to working around-the-clock if necessary to assess, repair and test mechanical equipment with a minimum of client downtime.

Where damage is due to mechanical or thermal fatigue, corrosion, normal wear or acute overloads, the cause will be identified and a reconditioning solution devised to minimise such damage in the future.

A&G Price has developed the processes to undertake vital time-sensitive maintenance and repairs with the minimum of disruption to work flow. Its team is able to make an on-site inspection, co-ordinate a shutdown over a weekend or other suitable off-peak period, and oversee removal of client plant to its own workshops for refurbishment or repair.

As a fully-integrated engineering works, A&G Price is able to undertake and project-manage all such remedial work in-house. By eliminating the need for sub-contractors, it is able to guarantee the high quality and timely completion of all projects.
